

INTELLIPULSAR

Extended-reach tool with downhole sensors enhances coiled-tubing performance

The INTELLIPULSAR incorporates downhole sensors that continuously record tubing pressure, annulus pressure, weight-on-bit, torque, temperature, gravity toolface, vibration and inclination. The downhole tool can be programmed to transmit measurement data from any or all sensors at specified intervals. Pulse signals can be reliably transmitted and decoded in coiled-tubing strings longer than 30,000 ft. All data is stored in the tool's memory for post-well analysis.

The system's pulser performs dual functions of developing force to extend the reach of coiled tubing and creates coded pressure pulses transmitting sensor readings to the surface. Rapid operation of the system's pulser generates pressure signals delivering axial thrust, advancing the BHA in horizontal sections of the well while simultaneously propagating a pressure wave to the surface, significantly increasing reach.

Real-time measurement and surface display of downhole weight-on-bit improves ability to time-drill plugs and generate smaller cuttings that are easier to circulate out of the hole.

In annular frac applications, the INTELLIPULSAR provides reverse circulation capability in the event of a screenout. The downhole tool is compatible with use of hydrochloric (HCl) and hydrofluoric (HF) acids which allows for sand-jet perforating.

INTELLIPULSAR data gives operators and service companies the ability to reduce risks and improve operating efficiencies by making informed decisions. Downhole weight-on-bit and differential pressure measurements eliminate costly actions based on the inference and guesswork inherent with using surface measurements without downhole data. Pulling out of the hole only when needed and avoiding unnecessary trips to change out downhole tools can save tens of thousands of dollars in completions costs.

The INTELLIPULSAR is made up in the bottomhole assembly directly above the downhole motor during plug millout operations so measurements are taken as close to the bit as possible.

DOWNHOLE SENSORS

- Weight-on-bit
- Torque
- Annular pressure
- Tubing pressure
- Inclination
- Temperature
- Gravity toolface
- Vibration

APPLICATIONS

- Milling
- Annular frac
- Fishing
- Cleanout

FEATURES

- Real-time and recorded data
- Surface data display
- Toggle pulser on/off from surface
- Programmable data transmission
- Real-time, adjustable thrusting force
- Reverse circulate
- Low pressure drop
- Post-well analysis

BENEFITS

- Better decisions
- Lower-risk extended-reach operations
- Superior hole cleaning
- Reduced operating cost

With unique knowledge in downhole sensor and pressure pulse technology, Teledrill develops and deploys innovative solutions to extend the reach and enhance efficiency of coiled-tubing operations.
